

Product Description

Micro Finish is a similar product to the A-600 Concrete Resurfacer. The difference is that Micro Finish contains no silica sand, although sand can be added. Micro Finish is comprised of powdered proprietary co-polymers that are very easy to use for renovation and resurfacing of concrete. Designed for use as a micro topping and can be used in virtually any climate due to its ability to resist freeze/thaw cycles.

Coverage Rate

Micro Finish when applied by squeegee will cover 300-600 square feet per bag depending upon the porosity of the concrete and application procedure.

Primary Use, Characteristics and Advantages

Micro Finish eliminates concrete removal and is a single component mixture (add water only). It has superior bonding capabilities, while maintaining flexibility and weather resistance. Micro Finish can be applied from 1/16 inch to a feather edge. Micro Finish has been designed for use as a micro-topping that is water resistant and nonreemulsifiable. Micro Finish is environmentally friendly. Add 1 quart of A-400 when used as architectural finishes or wearing surfaces.

Typical Applications

Counter tops, walkways, patios, casinos, airport hangers, restaurants, parking structures, pool decks, one step tile set, curbs and gutters, driveways, bridges, tilt-ups and warehouse floors.
